

A PYTHON PROGRAM TO IMPLEMENT K-MEANS MODEL

Ex.No:9B

Date of Experiment: 25/10/2024

AIM:-

To implement a python program using a K-Means Algorithm in a model.

ALGORITHM:-

Step1: Import all the other necessary libraries(numpy as np, matplotlib.pyplot as plt and sklearn.tree,pandas as pd and seaborn as sns).

Step2: Select the number K to decide the number of clusters.

Step3: Select random K points or centroids. (It can be different from the input dataset). Step4:

Assign each data point to their closest centroid, which will form the predefined K clusters. Step5:

Calculate the variance and place a new centroid of each cluster.

Step6: Repeat the fourth steps, which means assign each datapoint to the new closest centroid of each cluster.

Step7: If any reassignment occurs, then go to step-5 else go to FINISH.

Step8: Train the model and plot the graph using scatterplot() function.

IMPLEMENTATION:-

```
data = pd.read_csv('../input/k-means-clustering/KNN (3).csv')
data.head(5)
```

```
Text(0.5, 1.0, 'Different Species Visualization')
```

```
req_data = data.iloc[:,1:]
req_data.head(5)
